US Permanent Resident — No Sponsorship Required

SUMMARY

Software Engineer experienced in designing and scaling fault-tolerant distributed systems, cloud-native applications, and intelligent data workflows. Owns software delivery end to end, from requirements decomposition and architectural design through automated testing, observability, and multi-region production support. Combines an M.S. in Computer Science with AI-assisted development and strict engineering standards.

TECHNICAL SKILLS

Languages: Java, Python, SQL
Distributed Systems: Microservices, Event-Driven Architecture, OO design principles, multi-threading
Backend & APIs: Spring Boot, Hibernate, REST, OpenAPI/Swagger
Data & Messaging: Apache Kafka, Azure SQL, PostgreSQL, Cosmos DB, Redis, NoSQL, Caching
Cloud & DevOps: Azure, AWS, GCP, Kubernetes, Docker, Jenkins, CI/CD, Maven, Gradle, Git, Splunk, Grafana, Terraform
Practices: Agile/Scrum, Code Review, Unit & Integration Testing (JUnit, Mockito), Root Cause Analysis, Release Management
AI-Assisted Development: Claude Code, GitHub Copilot, Codex, Cursor, LLM / RAG, ML, AI Agents

EDUCATION

M.S., Computer Science & Engineering — University of Texas at Arlington *Aug 2024 – May 2026*
Selected Coursework: Artificial Intelligence, Machine Learning, Design and Analysis of Algorithms
B.S., Computer Science & Engineering — Jawaharlal Nehru Technological University, India *Aug 2008 – May 2012*

PROFESSIONAL EXPERIENCE

University of Texas at Arlington Arlington, TX
Graduate Research Assistant *Jan 2025 – May 2026*
- Replaced manual data collection and cleaning across 3 research pipeline stages with automated Python, Pandas and NumPy pipelines, plus Azure RAG retrieval.

Walmart Global Tech Sunnyvale, CA
Senior Software Engineer *Oct 2021 – Nov 2023*

Cross Border Transportation
- Engineered a high-availability multi-modal shipment engine, enabling dynamic routing across 3 distinct freight modes by developing weight-based carrier allocation algorithms for Parcel, LTL, and FTL flows.
- Standardized external carrier and customs integrations, supporting shipments across 3 international markets (US, MX, CA) by designing a unified Java adapter framework with multi-tenant routing.
- Optimized quotation management workflows, eliminating gateway timeouts for slow carriers by designing a dual-path synchronous/asynchronous routing engine over Cosmos DB.
- Built event-driven tracking pipelines for 5000+ weekly carrier status events, correlating each to its Cosmos DB booking draft to keep warehouse PO creation consistent.

Seller Management Service
- Architected a Tier 1 seller-management microservice, serving ~100K daily API calls across 15 cross-domain systems by deploying Java Spring Boot and Docker containers onto Kubernetes across 2 active Azure regions.
- Orchestrated the zero-downtime migration of a legacy monolith, eliminating deployment rollbacks by ramping config-driven traffic from 2% to 100% across 4 releases gated on Splunk and Grafana observability dashboards.
- Kept seller lifecycle workflows running through regional failover across two Azure regions with multi-threaded Kafka consumers, retry logic and request interceptors.
- Expanded multi-tenant RESTful services from 4 to 11 endpoints, reducing status validation latency to under 80ms p95 by integrating OpenAPI contracts and a caching tier.

Serial Number Capture
- Designed the backend architecture for Serial Number Capture, enabling item-level traceability for warehouse returns by modeling a 3-table relational database schema and a serial-mask rule engine.
- Delivered 8 paginated RESTful API contracts, supporting bulk processing of 1-100 items per request with unified error semantics and correlation-ID tracing across seller-facing and internal warehouse consumers.

Chewse San Francisco, CA
Software Engineer *Mar 2019 – Mar 2020*
- Streamlined contract-worker scheduling, reducing weekly operational time from 15 hours to 2 by developing a combinatorial shift-assignment tool using Python, Django, Celery, and Redis.
- Enhanced client-vendor logistics, raising match accuracy by 30% by re-tuning the underlying greedy search algorithm.

Johnson Controls Indianapolis, IN
Software Engineer *May 2018 – Oct 2018*
- Improved an AWS-hosted device health monitoring platform, driving a 23% reduction in customer-reported defects by translating user sessions into targeted Java, and SQL optimizations.

Provade Hyderabad, INDIA
Software Engineer *Sep 2013 – Mar 2015*
- Developed core enterprise procurement modules, accelerating reporting workflows by 20% by engineering scalable backend components in Java and SQL.
